The Gundersen Health System Sports Medicine ACL Reconstruction Rehabilitation Program is an evidence-based and soft tissue healing dependent program allowing patients to progress to vocational and sports-related activities as quickly and safely as possible. Individual variations will occur depending on surgical technique and the patient’s response to treatment. **Not all patients will utilize a post-operative brace.** If a *hamstring/gracilis autograft* is utilized, avoid isolated hamstring strengthening for 6 weeks. If an *Achilles tendon allograft* is utilized, patients may need to be cautioned not to advance too quickly as post-operative pain may be less. If a *meniscus repair* is performed in conjunction with the ACL reconstruction, follow the meniscus repair program for 0-3 wks, then switch to this program with restrictions including utilize post-op brace for 4-5 wks, no forced WB flexion stretch > 90 deg until 6 wks with goal of full ROM by 8-10 wks, no isolated hamstring strengthening for 6 wks, and no deep squatting >90 deg for 6 months. Please contact us at 1-800-362-9567 ext. 58600 if you have questions or concerns.

### Phase I: 0-6 weeks

**Immediate post op maximum protection phase**

**Goals**
- Protect surgical graft
- Minimize knee joint effusion
- Gently increase ROM per guidelines, emphasis on extension
- Encourage quadriceps function
- Prevent negative effects of immobilization
- Normalization of walking with good heel-toe pattern

**Brace**
- Not all patients will utilize a post-operative brace.
- wks 0-1: 0-90 deg, locked for ambulation and sleeping
- wks 1+: 0-120 deg, unlocked for ambulation when good quadriceps control and ext ROM
- wk 4: D/C brace

**ROM**
- wks 0-2: 0-90 degrees, emphasis on extension initially with gradual progression of flexion
- wks 2-3: 0-110 degrees
- wks 3-4: 0-120 degrees
- wks 6+: Full ROM

**WB**
- wk 0-1: WBAT with brace locked into extension
- wk 1-4: WBAT with brace unlocked if good quadriceps control and knee extension ROM. D/C crutches when can ambulate with normal heel-to-toe pattern.

**Precautions**
- If hamstring/gracilis autograft, no isolated resistance to knee flexion until wk 6. Start isometrics at wk 5. Progress to isotonics at wk 6. Also apply ice to posterior knee to minimize muscle spasm.
- Encourage AROM and WB to promote healing, prevent atrophy of soft tissue and bone, prevent a decrease in collagen content, and to align fibroblast and collagen fibrils.
- Emphasis on regaining extension ROM ASAP to prevent arthrofibrosis and decrease stress to the PF joint during ambulation.
- Avoid descending stair reciprocally until adequate quadriceps control and lower extremity alignment
- Avoid twisting and pivoting motions for 6-8 weeks to minimize shear forces to the healing graft.
- Avoid any isolated OKC resisted knee extension until 6 weeks

**Modalities**
- Cryotherapy 15 minutes in duration 3x/day
- IFC for pain/effusion if needed
- NMES quadriceps if needed

</table>
| **Goals**            | - Minimize knee joint effusion  
- Gently increase ROM with goal of full ROM by 6-8 weeks  
- Gradual progression of therapeutic exercises for strengthening, stretching, and balance |
| **ROM**              | - Progress to full ROM by 6-8 weeks.  
- Knee sleeve may be utilized depending on patient activities |
| **Brace**            | - Cryotherapy 15 minutes in duration 1-2x/day  
- IFC for pain/effusion if needed  
- NMES quadriceps if needed |
| **Modalities**       | - Avoid quick twisting and pivoting motions for 10-12 wks to minimize shear forces.  
- Implement quadriceps isotonic strengthening from 30-90 deg to avoid shear forces to the healing graft. |
| **Precautions**      | - Active warm-up: Bike with resistance, Nu Step, Treadmill walking  
- Stretching for full extension and flexion as needed.  
  - Low-load long duration stretching with heat if needed  
  - (1<sup>st</sup> TERT= Total End Range Time)  
  - Manual stretching for extension and/or flexion  
  - Leg press stretch for flexion  
- Flexibility exercises for hamstring, gastoc-soleus, iliopsoas.  
- Therapeutic exercises: Exercise in a pain-free manner. Avoid dynamic valgus during strengthening and functional activities. Incorporate total leg strengthening and balance / proprioception exercises.  
  - Biofeedback  
  - Total leg strengthening  
  - Hip strengthening  
  - Heel raises  
  - Hamstrings isotonics prone 0-90 deg  
  - Wk 9: Quadriceps isotonics 30-90 deg if minimal chondrosis  
  - Isokinetic quadriceps/hamstrings 30-90 deg; VSRP 180-300 deg/sec sub-max to max; progressing to 60-300 deg/sec.  
  - CKC exercises: Leg press 1:1, step-ups/step downs, Squats, Bosu 90 deg squats  
  - wk 7: Lunges to 90 deg, dead lifts, sideshuffle with T-band  
  - wk 8: Stairmaster, Euroglide, hamstring curls with physio ball  
  - wk 9: Sub-max impact activities,  
  - Balance / Proprioception training: Single leg stance activities  
  - static progressing to dynamic activities. Perturbation exercises  
  - CV conditioning / Core Stability  
- IFC for pain/effusion / NMES for quadriceps activation and control as needed  
- Ice (in stretch if needed) 2<sup>nd</sup> TERT  
- HEP for 3<sup>rd</sup> TERT if needed |
<p>| <strong>Independent strengthening</strong> | - wk 8-10: Progress to independent strengthening program with monthly rechecks if good ROM, minimal effusion or pain, and good muscle control |</p>
<table>
<thead>
<tr>
<th>Phase III: 12+ wks</th>
<th>Advanced strengthening and Return to activity phase</th>
</tr>
</thead>
</table>
| **Goals**         | ● Progress muscle strength, endurance, and balance activities. Ideally 3x/week of exercises at a fitness center, step-down, or home program  
                   ● Progress to higher level activities depending on functional demands and MD approval  
                   ● Return back to vocational, recreational, and sport activities |
| **Brace**         | ● Your MD may recommend a knee sleeve or functional brace to be used until 12 months from your surgery for higher level activities |
| **Modalities**    | ● Cryotherapy 15 minutes 1x/day or after strenuous activity |
| **Treatment**     | **Recommendations**  
                   ● Active warm-up: Bike, Elliptical Runner, Nu Step, Treadmill walking  
                   ● Continue with stretching and flexibility exercises as needed  
                   ● Strengthening and endurance exercises: Advance as tolerated with emphasis on functional strengthening. Avoid dynamic valgus during strengthening and functional activities.  
                   Total leg strengthening  
                   Hip strengthening  
                   Heel raises  
                   Hamstring full ROM isotonics  
                   4 months: Quadriceps isotonics 0-full flexion if minimal chondrosis  
                   Isokinetic quadriceps/hamstrings 0-full flexion if minimal chondrosis  
                   CKC exercises: Leg press, multiple direction lunges and step-ups, squats, sidestep with T-band  
                   Gastroc soleus exercise  
                   Stairmaster, Euroglide  
                   ● Dynamic balance exercises  
                   ● CV conditioning and core stability  
                   ● Ice |
| **Testing**       | ● wk 12 (3 months): Linea,  
                   Biodex 30-full flexion at 60 deg/sec  
                   Biodex 0-full flexion at 180 and 300 deg/sec,  
                   KT 1000  
                   ● wk 20-24 (5-6 months): Linea,  
                   Biodex 0-full flexion at 60 or 90, 180, 300 deg/sec,  
                   KT 1000,  
                   Functional testing |
| **Return to sport/ work guidelines** | ● wk 12 (3 months): Return to running program if MD clearance, no pain or effusion, strength scores on Linea and Biodex of 75%  
                   ● wk 16 (4 months): Plyometrics, agility drills, pivoting and cutting maneuvers  
                   ● wk 20-24 (5-6 months): Return back to sports progression based on MD approval, minimal pain at rest or with activity, no knee joint effusion, full pain-free ROM, isokinetic strength and functional testing at 90 % compared to uninvolved side, good performance on functional testing (90% compared to normative data or contralateral extremity) and adequate performance on sport-specific drills  
                   ● Sports progression may take 2-4 weeks for full clearance back to full competition |
